<p>G/TBT/N/USA/2017 14/07/2023</p>	<p>United States of America</p>	<p><i>Respiratory protection for all airborne hazards; Occupational safety. Industrial hygiene (ICS code(s): 13.100); Respiratory protective devices (ICS code(s): 13.340.30)</i> <b>Lowering Miners' Exposure to Respirable Crystalline Silica and Improving Respiratory Protection</b> Proposed rule; request for comments; notice of public hearings on 3 August 2023 in Arlington, Virginia and 21 August 2023 in Denver, Colorado - The Mine Safety and Health Administration (MSHA) proposes to amend its existing standards to better protect miners against occupational exposure to respirable crystalline silica, a carcinogenic hazard, and to improve respiratory protection for all airborne hazards. MSHA has preliminarily determined that under the Agency's existing standards, miners at metal and nonmetal mines and coal mines face a risk of material impairment of health or functional capacity from exposure to respirable crystalline silica. MSHA proposes to set the permissible exposure limit of respirable crystalline silica at 50 micrograms per cubic meter of air ([micro]g/m<sup>3</sup>) for a full shift exposure, calculated as an 8-hour time-weighted average, for all miners. MSHA's proposal would also include other requirements to protect miner health, such as exposure sampling, corrective actions to</p>	<p>28/08/2023</p>

be taken when miner exposure exceeds the permissible exposure limit, and medical surveillance for metal and nonmetal miners. Furthermore, the proposal would replace existing requirements for respiratory protection and incorporate by reference ASTM F3387-19 Standard Practice for Respiratory Protection. The proposed uniform approach to respirable crystalline silica occupational exposure and improved respiratory protection for all airborne hazards would significantly improve health protections for all miners and lower the risk of material impairment of health or functional capacity.
